1. INTRODUCTION

1.1 Purpose

This manual provides the information necessary to repair, description and download the features of this model.

1.2 Regulatory Information

A. Security

Toll fraud, the unauthorized use of telecommunications system by an unauthorized part (for example, persons other than your company's employees, agents, subcontractors, or person working on your company's behalf) can result in substantial additional charges for your telecommunications services. System users are responsible for the security of own system. There are may be risks of toll fraud associated with your telecommunications system. System users are responsible for programming and configuring the equipment to prevent unauthorized use. The manufacturer does not warrant that this product is immune from the above case but will prevent unauthorized use of common-carrier telecommunication service of facilities accessed through or connected to it.

The manufacturer will not be responsible for any charges that result from such unauthorized use.

B. Incidence of Harm

If a telephone company determines that the equipment provided to customer is faulty and possibly causing harm or interruption in service to the telephone network, it should disconnect telephone service until repair can be done. A telephone company may temporarily disconnect service as long as repair is not done.

C. Changes in Service

A local telephone company may make changes in its communications facilities or procedure. If these changes could reasonably be expected to affect the use of the this phone or compatibility with the network, the telephone company is required to give advanced written notice to the user, allowing the user to take appropriate steps to maintain telephone service.

D. Maintenance Limitations

Maintenance limitations on this model must be performed only by the manufacturer or its authorized agent. The user may not make any changes and/or repairs expect as specifically noted in this manual. Therefore, note that unauthorized alternations or repair may affect the regulatory status of the system and may void any remaining warranty.

1. INTRODUCTION

E. Notice of Radiated Emissions

This model complies with rules regarding radiation and radio frequency emission as defined by local regulatory agencies. In accordance with these agencies, you may be required to provide information such as the following to the end user.

F. Pictures

The pictures in this manual are for illustrative purposes only; your actual hardware may look slightly different.

G. Interference and Attenuation

Phone may interfere with sensitive laboratory equipment, medical equipment, etc.Interference from unsuppressed engines or electric motors may cause problems.

H. Electrostatic Sensitive Devices

ATTENTION

Boards, which contain Electrostatic Sensitive Device (ESD), are indicated & by the sign. Following information is ESD handling:

- Service personnel should ground themselves by using a wrist strap when exchange system boards.
- When repairs are made to a system board, they should spread the floor with anti-static mat which is also grounded.
- Use a suitable, grounded soldering iron.
- Keep sensitive parts in these protective packages until these are used.
- When returning system boards or parts like EEPROM to the factory, use the protective package as described.

2.1 H/W Features

Item	Specifications
Band	GSM DUAL Band(900/1800)
Туре	Bar type
Dimension	99.5 * 45 * 13.5mm
Weight	62g
Battery	750mAh Li-ion
Talk Time	Over 2hours @EGSM,TX Level : 5
Stand-by Time	Over 200 hours @Paging period : 5
RTC	Under 4 hours when removed battery.
Antenna	Internal Type(Dual-band)
LCD(Main)	1.52"(128x128 pixels), 65K Color STN LCD
Back Light	Yes
Back Light color	Blue
Vibrator	Yes
Speaker&Receiver	Yes(11x07 Receiver, 16®™ Speaker)
C-MIC	Yes
Earphone Jack	Mono or Stereo(Optional)
SIM	Yes(Plug in Type) : 3.0V
MIDI	16 poly
I/O Connect	18 Pins (included Earphone Jack)

3. TECHNICAL BRIEF

3.1 Digital Main Processor(PMB7880)

Figure. 3-1 PMB7880 FUNCTIONAL BLOCK DIAGRAM

3.1.1 Overview of E-GOLDvoice

The E-GOLDvoice is a GSM baseband modem including RF transceiver covering the low bands GSM850 /GSM900 and high bands GSM1800 / GSM1900 bands.

E-GOLDvoice is Dual Band, therefore, it supports by default a low / high pair of bands at the same time:

- 1. GSM850 / GSM1800
- 2. GSM850 / GSM1900
- 3. GSM900 / GSM1800
- 4. GSM900 / GSM1900

The E-GOLDvoice is optimized for voice-centric Mobile Phone applications.

The E-GOLDvoice is designed as a single chip solution that integrates the digital, mixed-signal, RF functionality and a direct-to-battery Power Management Unit.

The transceiver consists of:

- · Constant gain direct conversion receiver with an analog I/Q baseband interface
- Fully integrated Sigma/Delta-synthesizer capability
- · Fully integrated two-band RF oscillator
- Two-band digital GMSK modulator with digital TX interface
- Digitally controlled crystal oscillator generating system clocks.

The E-GOLDvoice supports a direct battery connection, hence eliminating the need for an external Power Management Unit. The E-GOLDvoice has different power down modes and an integrated power up sequencer.

The E-GOLDvoice is powered by the C166®S MCU and TEAKLite® DSP cores. The operating temperature range from -40C to 85C. It is manufactured using the 0.13 •Im CMOS process.

3. TECHNICAL BRIEF

3.1.2 Features

▶ Baseband

- · High performance fixed-point TEAKlite DSP
- C166S high performance microcontroller
- · There are several Interfaces:
 - I2S interface for DAI connections (for Tape Approval)
 - High Speed SSC Interface for connection of external peripherals
 - SIM Interface
 - Keypad Interface (6x4 or 5x5 keys)
 - EBU for external RAM/FLASH connection
 - Asynchronous serial interface
 - JTAG Interface
 - Black & white and color displays are supported
 - PWM source to drive vibrator
 - Keypad and display backlight supported.

▶ Receiver

- · Constant gain, direct conversion receiver with fully integrated blocking filter
- Two integrated LNAs
- · No need of interstage and IF filter
- · Highly linear RF quadrature demodulator
- · Programmable DC output level
- · Very low power budget.

▶ Transmitter

- Digital Sigma-Delta modulator for GMSK modulation, typical -163.5 dBc/Hz@20 MHz
- Single ended outputs to PA, Pout = +3.5 dBm
- · Very low power budget.

▶ RF-Synthesizer

- ΣΔSynthesizer for multi-slot operation
- Fast lock-in times (< 150 •Ïs)
- · Integrated loop filter
- RF Oscillator
- Fully integrated RF VCO.

Crystal Oscillator

• Fully digital controlled crystal oscillator core with a highly linear tuning characteristic.

- ▶ Mixed Signal and Power Management Unit
 - DC/DC boost for voltages up to 15V for driving White or Blue LEDs
 - 8-Ohm loud speaker driver (250/350mW)
 - 16-Ohm earpiece driver
 - 32-Ohm headset driver
 - 4 measurement interfaces (PA temperature, battery voltage, battery temperature, and ambient temperature)
 - Differential microphone input
 - · System start up circuitry
 - · Charger circuitry for NiCd, NiMh and Lilon cells
 - Integrated regulators for direct connection to battery.

3. TECHNICAL BRIEF

3.1.3 GSM System Description

The E-GOLDvoice is suited for mobile stations operating in the GSM850/900/1800/1900 bands. In the receiver path the antenna input signal is converted to the baseband, filtered, and then amplified to target level by the RF transceiver chipset.

Two A-to-D converters generate two 6.5 Mbit/s data streams. The decimation and narrowband channel filtering is done by a digital baseband filter in each path.

The DSP performs:

- 1. The GMSK equalization of the received baseband signal (SAIC support available)
- 2. Viterbi channel decoding supported by an hardware accelerator.

The recovered digital speech data is fed into the speech decoder.

The E-GOLDvoice supports fullrate, halfrate, enhanced fullrate and adaptive multirate speech CODEC algorithms.

The generated voice signal passes through a digital voiceband filter. The resulting 4 Mbit/s data stream is D-to-A converted by a multi-bit-oversampling converter, postfiltered, and then amplified by a programmable gain stage.

The output buffer can drive a handset ear-piece or an external audio amplifier, an additional output driver for external loud speaker is implemented.

In the transmit direction the differential microphone signal is fed into a programmable gain amplifier. The prefiltered and A-to-D converted voice signal forms a 2 Mbit/s data stream. The oversampled voice signal passes a digital decimation filter.

The E-GOLDvoice performs speech and channel encoding (including voice activity detection (VAD) and discontinuous transmission (DTX)) and digital GMSK modulation.

In the RF transceiver part, the baseband signal modulates the RF carrier at the desired frequency in the 850 MHz, 900 MHz, 1.8 GHz, and 1.9 GHz bands using an I/Q modulator. The E-GOLDvoice supports dual band applications.

Finally, an RF power module amplifies the RF transmit signal at the required power level. Using software, the E-GOLDvoice controls the gain of the power amplifier by predefined ramping curves (16 words, 11 bits).

For baseband operation, the E-GOLDvoice supports:

- · Making or receiving a voice call
- · Sending or receiving an SMS.

3.1.4 PMU Details

The E-GOLDvoice includes battery charger support (various sensor connections for temperature, battery technology, voltage, etc.) and a ringer buffer.

E-GOLDvoice avoids the need for an external power management component because its internal power management unit contains:

- · Voltage regulators for the On-chip and Off-chip functional blocks
- · Charger circuitry for NiCd, NiMh and Lilon cells.

3.1.5 Bus Concept

The E-GOLDvoice has two cores (a microcontroller and a DSP), each with its own bus.

There is an interconnection between the TEAKlite bus and the C166S X-Bus.

3.1.6 C166S Buses

The C166S is connected to three buses:

- 1. Local Memory (LM) bus
- 2. X-Bus
- 3. PD-Bus.

3.1.7 TEAKLite Bus

The TEAKlite is connected to the TEAKlite bus.

3.1.8 Bus Interconnections

The interconnection between the X-Bus and the TEAKlite Bus uses:

- Multicore Synchronization
- · Shared Memory.

3.1.9 Clock Concept

The E-GOLDvoice has a flexible clock control.

3.1.10 Interrupt Concept

The C166 MCU carries out the E-GOLDvoice interrupt system.

3.1.11 Debug Concept

The E-GOLDvoice includes a multi-core debug. The C166 and TEAKlite cores can be debugged in parallel with:

- · A single JTAG port (that is, on a single host)
- · Mutual breakpoint control.

3.1.12 C166 Debug Concept

The debugging of the C166 uses the OCDS and the Cerberus.

3.1.13 TEAKLite Debug Concept

TEAKlite debugging uses the OCEM and the SEIB.

3.1.14 Power Management

The E-GOLDvoice provides the power management unit (PMU) for the complete mobile phone application. The integrated PMU is directly connected to the battery and provides a set of linear voltage regulators (LDO's).

These LDO's generate all required supply voltages and currents needed in a low feature mobile phone. A charger control circuit charges NiCd, NiMH and Lilon batteries.

The charger control supports hardware controlled pre-charging and software controlled charging. It offers a wide charger voltage range, making halfwave/full-wave charging with cheap transformers possible.

White/blue backlight generation is supported with a special driver for very a low external parts count. Power consumption during operation phases is minimized due to flexible clock switching In the Standby Mode most parts of the device are switched off, only a small part is running at 32kHz and the controller RAM is switched to a power saving mode. The TEAKLite ROM can be switched off during Standby via SW.

3.1.15 On-Chip Security Concept

Secure boot is based on a public/private key approach. Flash images that are not signed with the private key during phone manufacture cannot be loaded.

Verification of the Flash code is done with the public key. The public key as well as hash and verify algorithms are stored in the ROM, which ensures a hardware secured boot procedure.

The following security features are supported:

- Prevention of illegal Flash programming
- Flash programming makes use of the E-GOLDvoice ID for personalization checks with IMEI and SIM-lock protection

The security features use the following mechanism:

- · Boot ROM flow:
 - Controls the boot transition to external flash
 - Controls the flash update
- Flash tied to the individual chip via an ID using e-fuses, that is, each E-GOLDvoice chip has its own fused ID.

Further details on the E-GOLDvoice security concept are not publicly documented.

3.1.16 Asynchronous Operation Mode Concept

The E-GOLDvoice can operate in either:

- The traditional synchronous mode with the 26MHz system clock synchronized on the base station
- · A special asynchronous mode (XO concept).

In the asynchronous mode the 26MHz clock input is not synchronized with the base station; the residual frequency offset is compensated in the digital signal processing domain. This processing includes frequency and timing compensation of the baseband and voiceband signals.

VCC1 GSM IN Match **HBT** BiCMOS PΑ Match GSM OUT Integrated VBATT -POWER CONTROL VAPC Amplifier ENABLE -Controller BAND SELECT -PA Match DCS/PCS OUT DCS/PCS IN -Match MODULE 103237 001 GND

3.2 Power Amplifier Module (SKY77318)

Figure. 3-2 SKY77318 FUNCTIONAL BLOCK DIAGRAM

The SKY77318 Power Amplifier Module (PAM) is designed in a low profile (1.2 mm), compact form factor for quad-band cellular handsets comprising GSM850/900, DCS1800, and PCS1900 operation. The PAM also supports Class 12 General Packet Radio Service (GPRS) multi-slot operation.

The module consists of separate GSM PA and DCS1800/PCS1900 PA blocks, impedance-matching circuitry for 50 Ω input and output impedances and a Power Amplifier Control (PAC) block with an internal current-sense resistor. The custom BiCMOS integrated circuit provides the internal PAC function and interface circuitry.

Fabricated onto a single Gallium Arsenide (GaAs) die, one Heterojunction Bipolar Transistor (HBT) PA block supports the GSM bands and the other supports the DCS1800 and PCS1900 bands. Both PA blocks share common power supply pins to distribute current.

The GaAs die, the Silicon (Si) die, and the passive components are mounted on a multi-layer laminate substrate. The assembly is encapsulated with plastic overmold.

RF input and output ports of the SKY77318 are internally matched to a 50 Ω load to reduce the number of external components for a quad-band design. Extremely low leakage current (2.5 μ A, typical) of the dual PA module maximizes handset standby time. The SKY77318 also contains bandselect switching circuitry to select GSM (logic 0) or DCS/PCS (logic 1) as determined from the Band Select (BS) signal.

In Figure 1 below, the BS pin selects the PA output (DCS/PCS_OUT orGSM_OUT) and the Analog Power Control (VAPC) controls the level of output power.

The VBATT pin connects to an internal current-sense resistor and interfaces to an integrated power amplifier control (iPAC™) function, which is insensitive to variations in temperature, power supply, process, and input power.

The ENABLE input allows initial turn-on of PAM circuitry to minimize battery drain.

E-GOLDvoice Digital Baseband E-GOLDvoice RF Subsystem Analog I/IX, XoCal. XoTune MCU ! RF control CK.DA.E DIGEIL BUS Fsys1 Buffer Clock FSYS1 AFC DAG DCXO Core XOX XO

3.3 26 MHz Clock (DCXO)

Figure. 3-3 E-GoldVoice DCXO Overview

DCXO (Digitally Controlled Crystal Oscillator) and VCTCXO (Voltage Controlled Temperature Compensated Crystal Oscillator) are two different techniques used To maintain the mobile's reference oscillator's accuracy over time. The reference oscillator's accuracy over time will vary due to initial crystal frequency offset, temperature drift and aging.

These static and dynamic frequency variations have to be compensated, otherwise the mobile would be in danger of losing connection to the network.

The technique used to perform the frequency compensation is generally termed Automatic Frequency Control (AFC).

To summarize the operation of DCXO, GSM Baseband processor will calculate the AFC compensation (which is continuously updated) required based on the measured frequency error. Then the required AFC compensation is sent to the LUXO (Lineari-Zation Unit of Crystal Oscillator), which in turns control the DCXO core and generates The 26MHz system clock.

3.4 RTC(32.768KHz Crystal)

32.768KHZ CRYSTAL

Figure. 3-4 E-Gold Voice RTC Interface

The integrated Real Time Clock (RTC) is able to provide programmable alarm functions and external interrupts. Due to its extreme low power consumption the RTC can be supplied from a small backup battery. This allows the generation of external interrupts, even when the main PMB7880 supply voltage is switched off. For this purpose the RTC is powered by own voltage supply pins VDD_RTC and VSS_RTC.

The RTC shall be driven by a 32.768 kHz (32k) clock which needs to be applied via the PMB7880 F32K and OSC32K pins. The clock can be fed from either an external clock source or use the on chip 32 KHz oscillator module.

The low clock frequency and the optimized low power design give the possibility to run the chip with a minimum of power dissipation. For example, for this specific application the 26 MHz reference oscillator can be switched off during system standby and a lowpower time reference can be kept when the 32k clock is provided to the RTC.

The RTC consists of an PMB7880 specific RTC shell, containing the RTC macro, as well as the 32 kHz oscillator, as described in the following sections. The module RTC Shell solely performs level translation of the 32KHz clock to the VDD_LD1 power supply domain, and is not functionally associated with the RTC.

3.5 LCD Interface(3-wire SPI interface)

Figure 3-5-1. LCD Interface

Figure 3-5-2. Charge pump interface

Signals	Description
CS3	This signal enable to access to the driver IC of LCD.
SSC0_MTSR	This signal transfer serial data to driver IC.
SSC0_CLK	This signal transfer serial clock to driver IC.
LCD_RESET	This signal makes driver IC to HW default status.
MLED	This signal provide power to white LEDs.
MLED1/2	This signal be feed back from white LEDs.
2V8_VIO	This signal provides power to LCD modules.(2.8V)

The AAT3157 is a low noise, constant frequency charge pump DC/DC converter that uses a trimode load switch (1X), fractional (1.5X), and doubling (2X) conversion to maximize efficiency for white LED applications. The AAT3157 is capable of driving up to three channels of LEDs at 20mA per channel from a 2.7V to 5.5V input.

The current sinks may be operated individually or in parallel for driving higher current LEDs. A low external parts count (two 1μ F flying capacitors and two small 1μ F capacitors at VIN and VOUT) make this part ideally suited for small, battery-powered applications. AnalogicTech's S2CwireTM (Simple Serial ControlTM) serial digital input is used to enable, disable, and set current for each LED with 16 settings down to 50μ A.

The low-current mode supply current can be as low as 50μ A to save power.

Data	Output (mA/Ch)	Data	Output (mA/Ch)
1	20.0	9	5.0
2	17.0	10	4.2
3	14.0	11	3.4
4	12.0	12	2.8

6	8.6	14	0.5
7	7.0	15	0.1
8	6.0	16	0.05

Figure 3-5-3. Charge pump Output Current

3.6 SIM Card Interface

Figure 3-6. SIM CARD Interface

The EGoldVoice provides SIM Interface Module. The AD6527 checks status Periodically During established call mode whether SIM card is inserted or not, but it doesn't check during deep sleep mode. In order to communicate with SIM card, 3 signals SIM_DATA, SIM_CLK, SIM_RST.

Signals	Description
SIM_RST	This signal makes SIM card to HW default status.
SIM_CLK	This signal is transferred to SIM card.
SIM_DATA	This signal is interface datum.

3.7 KEYPAD Interface

Figure 3-7 KEY MAXTRIX Interface

The keypad interface is connected to the X-Bus, together with the XBIU and the Shared Memory Register, using a single Bus Interface.

The keypad supports two scan modes:

- By default, the keypad is a 4x6 scan matrix (4 input and 6 output pins).
- To set the keypad to a 5x5 scan matrix (5 input and 5 output pins)

The scan mode should be determined at the very beginning of the system start because changes are not allowed later.

3.8 Battery Charging Block Interface

CHARGING IC

Figure 3-8. Charging IC Interface

The AAT3681A is a high performance battery charger designed to charge single Cell lithiumion/polymer batteries with up to 500mA of current from an external power source. It is a stand-alone charging solution, with just one external component required For complete functionality. The AAT3681A precisely regulates battery charge voltage and current for 4.2V lithium-ion/polymer battery cells.

The adapter/USB charge input constant current level can be programmed up to 500mA for rapid charging applications.

The AAT3681A has four basic modes for the battery charge cycle: pre-conditioning/trickle charge; constant current/fast charge; constant voltage; and end of charge.

3.9 RF Interface

Figure 3-9-1. ASM interface

Figure 3-9-2. SAW Filter interface

E-GOLDvoice features a fully integrated constant-gain direct conversion receiver, i.e. there is no interstage filter needed and the baseband level at the analogue IQinterface follows directly the RF input level. Depending on the baseband ADC dynamic range, single- or multiple-step gain switching schemes are possible.

An integrated, selfaligning, low-pass filter ensures the receivers to function under blocking and reference interference conditions and avoids aliasing by baseband sampling. An automatic DC-offset compensation is implemented and can be switched depending on the gain setting.

Figure 3-9-3. PAM(Power Amplifier Module) interface

The digital transmitter architecture is based on a fractional-N sigma-delta synthesizer for constant envelope GMSK modulation. This configuration allows a very low power design with a reduced external component count.

The modulation is transferred between baseband- and RF-part of the PMB7880 via a digital interface signal into the digital modulator.

The following Gaussian filter shapes the digital data stream for the GMSK modulation. Additionally a pre-distortion filter compensates the attenuation of the PLL transfer function resulting in a very low distortion at the transmit output.

The filtered digital data stream is scaled appropriately and added to the channel word. This sum is fed into the MASH modulator. The output of the MASH modulator is a sequence of integer divider values representing the high resolution fractional input signal. This sequence controls the MMD (multi modulus divider) at a sample rate of 26MHz. Thus a tightly controlled frequency modulation of the VCO is achieved.

3.10 Audio Interface

Figure 3-10-1 Audio interface

The audio front-end of E-GOLDvoice offers the digital and analog circuit blocks for both receive and transmit audio operation and ringing. It features a high-quality, digital-to-analog path with amplifying stages for connecting acoustic transducers to the E-GOLDvoice. In the transmit direction the supply voltage generation for microphones, low-noise amplifier and analog to digital conversion are integrated on the E-GOLDvoice.

For E-GOLDvoice the EPp1/EPn1 driver are used as differntial Earpiece-Driver, EPPa1 is used as single-ended Headset-Driver.

The audio front-end itself can be considered to be organized in three sub-blocks:

- Interface to processor cores (TEAKlite and indirectly C166S)
- · Digital filters
- · Analog part.

3. TECHNICAL BRIEF

The interface to the processor cores consists of a direct physical connection to the TEAKlite DSP bus and a set of firmware commands to handle communication between the C166S and the audio frontend which serves as the interface peripheral for audio algorithms running on the DSP or the controller. The audio front-end Generates interrupts on certain occasions, for example, when exchange of data is requested. The core interface part of the audio front-end also contains the control and status registers which are used to set up certain operation modes of the peripheral.

The section next to the core interface contains the digital filters for interpolation and decimation of the audio signals being received and transmitted. The data path for the receive direction can be set up to process sampling rates between 8kHz and 48kHz.

The interpolation filters for the respective sampling rates are implemented in a dedi-cated hardware block and are automatically selected to suite the chosen sampling rate.

Low-pass interpolation filtering, which produces an unsigned 16-bit data stream with a sampling rate of 4 MHz, is performed digitally. D-to-A conversion, postfiltering, and final amplification are performed on the analog part. The amplifier buffer for voiceband receive does also support ringer functionality. The ringer functionality is activated by Setting bits RINGSELPN or RINGSELPA in the voiceband part of the analog control register.

In transmit direction, amplification, prefiltering and A-to-D conversion (analog $\sum \Delta$ modulation) are performed on the analog part. The resulting 2-Mbit/s data stream is filtered by a digital low-pass decimation filter for further processing by DSP firmware.

Two sampling rates, 8kHz and 16kHz, are supported.

The analog section contains all the necessary analog functional blocks including microphone supply generation, output and input amplifiers and analog filtering.

Signals	Description
EPp1	Main Receiver Positive signal(Differential signal)
EPn1	Main Receiver Negative signal(Differential signal)

3.13 Memory Interface

Figure 3-13 Memory interface

In E-GOLDvoice, the 16bits demultiplex X-bus interface is used for memory device support. NOR Flash memory is supported. (The NAND Flash memory is not supported). The page mode can be supported for flash memories.

Up to 8MBytes of external RAM and/or ROM can be connected to the MCU via its external bus interface.

Up to 3 external CS signals can be generated to save external glue logic.

Access to very slow memories is supported via a special 'Ready' function.

The system MCU clock is set to run with 26Mhz.

3.14 Power Block Interface

Figure 3-14-1 Power Block interface

The E-GOLDvoice integrated power management unit (PMU) supports direct connection to battery (DCB). That means all supply voltages needed are generated on-chip with integrated linear voltage regulators. The input of these linear voltage regulators is the battery voltage. The external memory and SIM card supply is provided by the on-chip voltage regulators. Table 144 is an overview of the internal generated supply voltages.

The integrated power management also provides the control state machine for system start up, including start up with discharged batteries, trickle charging and system reset control. After system start up several methods are implemented for active and idle power saving.

Name	Output Voltage(V)	Output Current (mA)	Comment	
LRTC	2.0	4	Used for the real time and digital PMU supply	
LD1	1.2/1.5	150	Used for the core supplies (MCU and DSP via switch)	
LIO	1.8/2.85	30	Used for the I/O pad supply and, for example, the display	
LRFXO	2.5	10	Used for the crystal oscillator supply	
LMEM	2.5	100	Used for the external memory supply, voltage can be	
			configured during startup	
LANA	2.5	100	Used for analog (audio and baseband processing) and	
			headset driver	
LSIM	1.8/2.85	30	Used of the SIM card supply	
LBUF	2.6/2.8/3.0/3.2	300	Used for the loudspeaker and earpiece driver	
LRFRX	2.5	100	Used for the RF RX part	
LRFTRX	1.5	120	Used for the RF TX/TX part	

Figure 3-14-2 EGold Voice PMU

LDO output voltage selection

- LD1, LIO, LSIM, LBUF output voltage programmable by software.
- LMEM output voltage is selectable by pin configuration upon startup.

Active and idle power saving options:

- The flexible clock switching options allow minimizing the power consumption during the operation phases of the E-GOLDvoice.
- Current consumption during the standby mode is minimized by reducing the clock to 32 kHz and switching it off for most of the device. In addition, the power supply for the TEAKLite ROM is switched off and the controller RAM is switched to a power saving mode.

Start-up and Reset Control State Machine Features

- Power up upon battery insertion, push button, alarm, charger connection.
- Detection of battery exchange or re-insertion.
- · Complete start-up sequence management.
- System turn-on, system turn-off operation management including emergency (under-voltage) and programmed shutdown functions.
- Internal reset of the baseband, including silent reset.
- Tri-state function of the baseband module.
- Standby mode controlled by VCXO_EN provided by SCCU module.

3.15 FM Radio Interface

3.15.1 FM Tunner

The Si4702 patented digital low-IF architecture reduces external components and eliminates the need for factory adjustments. The receive (RX) section integrates a low noise amplifier (LNA) supporting the worldwide FM broadcast band (76 to 108 MHz). An automatic gain control (AGC) circuit controls the gain of the LNA to optimize sensitivity and rejection of strong interferers.

For two-wire operation, a transfer begins with the START condition. The control word is latched internally on rising SCLK edges and is eight bits in length, comprised of a seven bit device address equal to 0010000b and a read/write bit (write = 0 and read = 1). The device acknowledges the address by setting SDIO low on the next falling SCLK edge. For write operations, the device acknowledge Is followed by an eight bit data word latched internally on rising edges of SCLK.

The device always acknowledges the data by setting SDIO low on the next falling SCLK edge. An internal address counter automatically increments to allow continuous data byte writes, starting with the upper byte of register 02h, followed by the lower byte of register 02h, and onward until the lower byte of the last register is reached. The internal address counter then automatically wraps around to the upper byte of register 00h and proceeds from there until continuous writes cease. Data transfer ceases with the STOP command. After every STOP Command, The internal address counter is reset. For read operations, the device acknowledge is followed by an eight bit data word shifted out on falling SCLK edges. An internal address counter automatically increments to allow continuous data byte reads, starting with the upper byte of register 0Ah, followed by the lower byte of register 0Ah, and onward until the lower byte of the last register is reached. The internal address counter then automatically wraps around to the upper byte of register 00h and proceeds from there until continuous reads cease. After each byte of data is read, the controller IC should return an acknowledge if an additional byte of data will be requested. Data transfer ceases with the STOP command. After every STOP command, the internal address counter is reset.

3.15.2 Headphone Amplifier

The MAX4411 fixed-gain, stereo headphone driver features Maxim's patented DirectDrive architecture, eliminating the large output-coupling capacitors required By conventional single-supply headphone drivers. The device consists of two 80mW Class AB headphone drivers, internal feedback network (fixed -1.5V/V gain), undervoltage lockout (UVLO)/shutdown control, charge pump, and comprehensive click-and-pop suppression circuitry.

5. DOWNLOAD

5.1 Download Setup

Configure system like figure 5-1.

Figure 9-1. Download Setup

5.2 Download Process

5.2.1. Download step[1]

(A): Start or Stop download

B: Selected configuration DLL file

©: File name donwloading

 $File(F) \rightarrow Exit(X)$: End program

 $Setting(S) \rightarrow Configuration: configuration download condition DLL, SW files and etc.\\$

 $About(H) \rightarrow MultiGSM$: Provide version information

First, select Setting Menu.

5.2.2. Download step[2]

- (A): Select a appropriated DLL file
 - You must select KG285_xxxxxx.DLL file.
- **B**: Select configuration file

You must select cmd.m0 file

©: Select download speed

You must 460800. System supports maximum 460800bps.

①: Select port

select start and end port be operated

5.2.3. Download step[3]

(A): Select files downloaded

KG285 have 4 files, *.eep, *.fls, *.dffs and *.cust.

But You must not select *.eep file.

5.2.4. Download step[4]

(A): Start download and stop download next step.

If configuration is finished, then push start button and then button is changed to STOP.

Turn on power of multi download and connector phones.

If download is started, then push start button else program will download repeatedly.

5.2.5. Download step[5]

(A): This region appears donwload status.

If download is finished, PASS or FAIL.message is showed.

9. ENGINEERING MODE

9.1 About Engineering Mode

Engineering mode is designed to allow a service man/engineer to view and test the basic functions provided by a handset.

9.2 Access Codes

The key sequence for switching the engineering mode on is 2945#*#. Pressing END will switch back to non-engineering mode operation.

9.3 Key Operation

Use Up and Down key to select a menu and press 'select' key to progress the test. Pressing 'back' key will switch back to the original test menu.

9.4 Engineering Mode Menu Tree

* FM Radio function is not supported

9.4.1 BB Test

9.4.1.1 Backlight

- backlight on : LCD backlight is off.
 backlight off : LCD backlight is on.
- 3 backlight value: LCD backlight brightness is controlled by 20% from 100 to 0.

9.4.1.2 LCD

① LCD color: This menu includes 5 color menu and automatic color change.

5 color menu is Red, Green, Blue, Black and White.

② LCD contrast: This menu displays a contrast value and LCD maker.

9.4.1.3 Battery Info

This menu displays the information of battery, as example battery voltage level and temperature.

In line 2, battery voltage level is displayed with average and instant value.

In line 3. battery temperature value is displayed, but this value is ADC value.

In line 4. Icon number of battery voltage is displayed.

9.4.1.4 Vibrator

This menu can control vibrator on and off operation.

9.4.1.5 Audio

This menu can control MIDI operation

9. ENGINEERING MODE

Model Version

9.4.2 Model Version

This menu displays the Model software version.

9.4.3 Eng Mode

9.4.3.1 Serving Cell

This Menu dispays the the informations of Serving Cell environment.

For example, ARFCN, RF Level etc.

ARFCN : Absolut Radio Frequency Channel Number (Frequency Number) of Serving Cell while Idle mode

RxLev: RX level of Serving Cell while Idle mode

C1 : C1 Value of Serving Cell, This value will be used to decide cell reselection. C2 : C2 Value of Serving Cell, This value will be used to decide cell reselection.

BPM: Paging period of Serving Cell

ARFCND : Absolut Radio Frequency Channel Number (Frequency Number) of Serving Cell while Dedicated mode

RxLf: Full RX level of Serving Cell RxLs: Sub RX level of Serving Cell RxQf: Full RX qual of Serving Cell RxQs: Sub RX qual of Serving Cell DSC: Downlink Signal Counter RLL: Radio Link Loss Counter

Chtyp: Channel type of Serving Cell Chmod: Channel Mode of Serving Cell

DTX: Discontinuous Transmission mode of Serving Cell

MCC : Mobile Country Code of Serving Cell MNC : Mobile Country Code of Serving Cell LAC : Location Area Code of Serving Cell

CID : Cell ID of Serving Cell

BSIC: Base Tranceiver Station Identity Code of Serving Cell TxPwrMax: MS_TXPWR_MAX_CCH value of Serving Cell RxMin: RXLEV ACCESS MIN value of Serving Cell

C2vld: C2 VALID value of Serving Cell

CRoff : CELL_RESELECT_OFFSET value of Serving Cell TMPoff : TEMPORARY_OFFSET value of Serving Cell

PTime: PENALTY TIME value of Serving Cell

RF#: Number of frequencies in MA(Mobile Allocation)

T3212 : Periodic Location Update Timer TxPwrLev : Current Tx power of MS

ACC : Access Control Class
Band : Current Band Information
TA : Current Timing Advance

Cipher: Cipher mode of Serving Cell CBQ: Cell Bar Quality flag of Serving Cell CBA: Cell Bar Access flag of Serving Cell

9. ENGINEERING MODE

9.4.3.2 Neighbour Cells

This menu displays the informations of Neighbour Cells.

ARFCN: Absolut Radio Frequency Channel Number (Frequency Number) of Neighbour Cell

RxLev: Rx Level of Neighbour Cell

C1 : C1 Value of Neighbour Cell, This value will be used to decide cell reselection. C2 : C2 Value of Neighbour Cell, This value will be used to decide cell reselection.

MCC: Mobile Country Code of Neighbour Cell MNC: Mobile Network Code of Neighbour Cell LAC: Location Area Code of Neighbour Cell

CID: Cell ID of Neighbour Cell

BSIC: Base Tranceiver Station Identity Code of Neighbour Cell

9.4.3.3 Reset Information

This menu displays the information of reset point in source code, call stack.

Call Timer

9.4.4 Call Timer

This menu displays the time of all calls, including the received calls.

Factory Reset

9.4.5 Factory Reset

This menu is to format data block in the flash memory and this procedure set up the default value in data block.

* function is not supported

9.4.6 MF TEST

This manufacturing mode is designed to do the baseband test automatically. Selecting this menu will process the test automatically, and phone displays the previous menu after completing the test.

9.4.6.1 All auto Test

LCD, Backlight, Vibrator, Buzzer, Key Pad

9.4.6.2 Backlight

LCD Backlight is on for about 1.5 seconds at the same time, then off.

9.4.6.3 Audio

This menu is to test the volume of Melody. It rings in the following sequence. Volume 1, Volume 2, Volume 3, Volume 0 (mute), Volume 4, Volume 5.

9.4.6.4 Vibrator

Vibrator is on for about 1.5 seconds.

9.4.6.5 LCD

Main LCD screen resolution tests horizontally and vertically one by one and fills the screen.

9.4.6.6 Key Pad

When a pop-up message shows 'Press Any Key', you may press any keys. If the key is working properly, name of the key is displayed on the screen.

10. CALIBRATION

10.1 Test Equipment Setup

10.2 Calibration Steps

- 10.2.1 Tune on the phone
- 10.2.2 Execute "HK_28.exe"

10.2.3 Click "SETTING" Memu

10.2.4 Setup "Ezlooks" menu such as the following fugure

10.2.5 Setup "Line System" menu such as the following fugure

10.2.6 Setup Logic operation such as the following figure

10.2.7 Select "MODEL"

10.2.8 Click "START" for RF calibration

10.2.9 RF Calibration finish

10.2.10 Calibration data will be saved to the following folder

11. STAND ALONE TEST

11.1 Test Program Setting

- 11.1.1 Set COM Port
- 11.1.2 Check PC Baud rate(115200)
- 11.1.3 Confirm EEPROM & Delta file prefix name

11.1.4 Click "V24AT#ON" and then "Update Info" for communicating Phone and Test Program

- 11.1.5 For the purpose of the Standalone Test, Change the Phone to "ptest mode" and then Click the "Reset" bar.
- 11.1.6 Select "Non signaling" in the Quick Bar menu. Then Standalone Test setup is finished.

11.2 Tx Test

11.2.1 Click "Non signaling mode" bar and then confirm "OK" test in the command line

- 11.2.2 Put the number of TX Channel in the ARFCN
- 11.2.3 Select "TX" in the RF mode menu and "PCL" in the PA Level menu
- 11.2.4 Finally, Click "Write All" bar and try the efficiency test of Phone

11. STAND ALONE TEST

11.3 RX Test

- 11.3.1 Put the number of RX Channel in the ARFCN
- 11.3.2 Select "RX" in the RF mode menu
- 11.3.3 Finally, Click "Write All" bar and try the efficiency test of Phone
